Micro-WDM for Reconfigurable Military Information Systems

- Platforms and WDM
- Micro-WDM Comparison
- Switch Comparison
- Roadmap

Micro-WDM for Reconfigurable Military Information Systems

A Potentially Ubiquitous Technology

Space: Space-Based Radar

- Air: UCAV

Ground: Telco

Sea: Advanced Networks

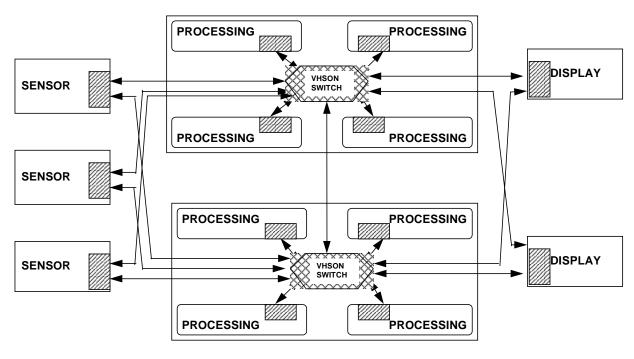

System Benefits Include:

- Reduced Size, Weight, Power, Parts Count, System Complexity
- Growth/ Upgrade Facilitation
- Increased Bandwidth, Fault Tolerance, System Flexibility

Configurable High Speed Optical Networks (Near Term)

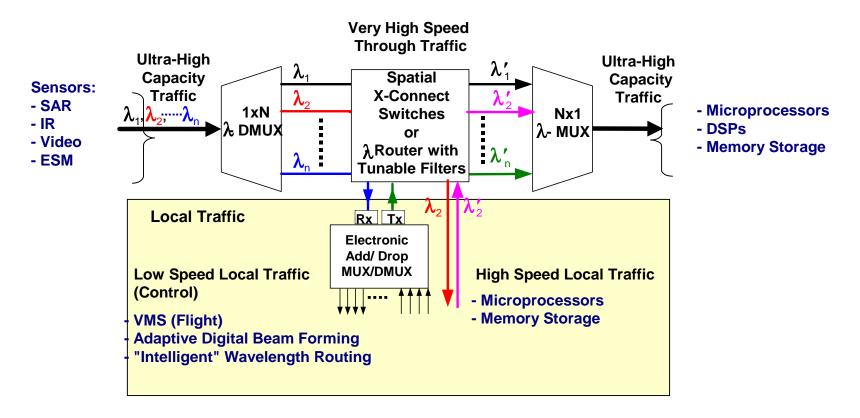

Tactical Aircraft

- High Bandwidth Fiber Optic I/O for Remote Sensor Fusion, Processing, Storage, and Control
 - IR (eg. hyperspectral), Video, SAR, ESM
 - Microprocessor and Memory
 - Flight Control (Migration from Electrical to Optical)
- Optical Routed Paths (Mesh) (eg. Monterey/ Cisco)
 - Electrical SEM-E Circuit Switch Upgrade
- Scalable, Optical Routable Paths for "Very High Speed Optical Networks" (VHSON)

VHSON INTERFACE CIRCUIT (VIC)

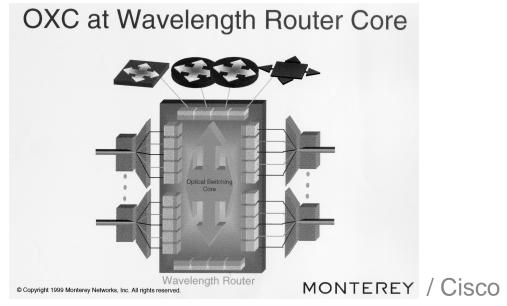

Configurable Optical Wavelength and IP Network (Notional)

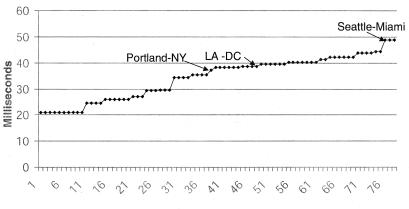

Configurable optical wavelength and IP networks will:

- switch low speed packets of IP data
- establish wavelength circuits or paths for high speed IP data
- establish paths in real-time

Power Dissipation of This Wavelength Router Will Be Greatly Reduced with an Optical Switch Core!

Dynamic Wavelength Routing Protocol (WARP) Distributed Mesh WaRP Restoration Times

Number of Paths Restored

Micro-WDM Technology for Reconfigurable Network Systems

Technology	COTS Array WG Device	Photonic Bandgap (PBG)	Microresonators (MR)	
State-of-Art R&D	AVVG-1x16-100G-1-5-M fearer from the Park fr			
	Photonic Integration Research Inc.	Joannopoulos et. al. (MIT) theory & exp.	Nanovation Tech. Inc. S. T. Ho et. al.	
Maturity	64 Channel Devices Available	Patents, 10 yrs. R&D 1 channel filter 5 yr. est. avail.	Patents, 10 yrs. R&D few channel filter avail. today	
Insertion Loss	8 dB	3-4 dB (from fiber)	3-4 dB (from fiber)	
Crosstalk	22 dB	TBD	TBD	
Potential Channel Separation (1500 nm)	50 GHz	< 50 GHz	< 50 GHz	
Size	10 cm x 5 cm x 2 cm	1 μm³ (fiber driven)	1 μm³ (fiber driven)	

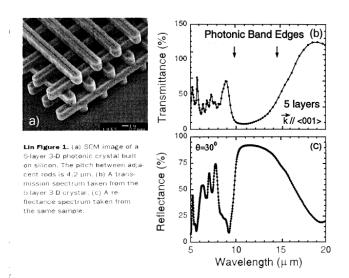

Approaches to Micro-WDM Photonic Crystals with Photonic Bandgaps (PBG)

Approach	Technology	Advantages	
PBG microcavity filters in series (see Fan et al, <i>Opt. Express</i> , 3, p.4, 1998 for example)	Photonic crystal of dielectric rods or PBG air bridge in Si	 Very large Q cavities little crosstalk between channels Tolerance to fabrication imperfections Very small ~(λ/2n)³ 	
Mi	croresonators (MR)		
Approach	Technology	Advantages	
• Extension of high density integrated optics with large ∆n	MicroresonatorsNanovationNWU, MIT	• Commercially available in few element arrays	

Photonic Crystal Super- Prisms

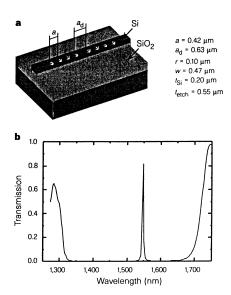

Examples of Photonic Band Gaps

Creation of a 3-D Silicon Photonic Crystal

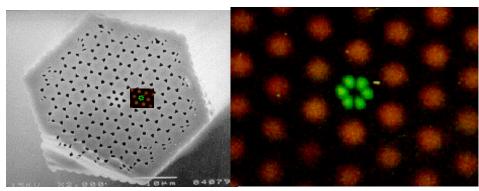

Shawn-Yu Lin and J.G. Fleming, Sandia National Laboratories, Optics and Photonic News / p. 35, December 1998

Photonic Bandgap Filter in Optical Waveguide

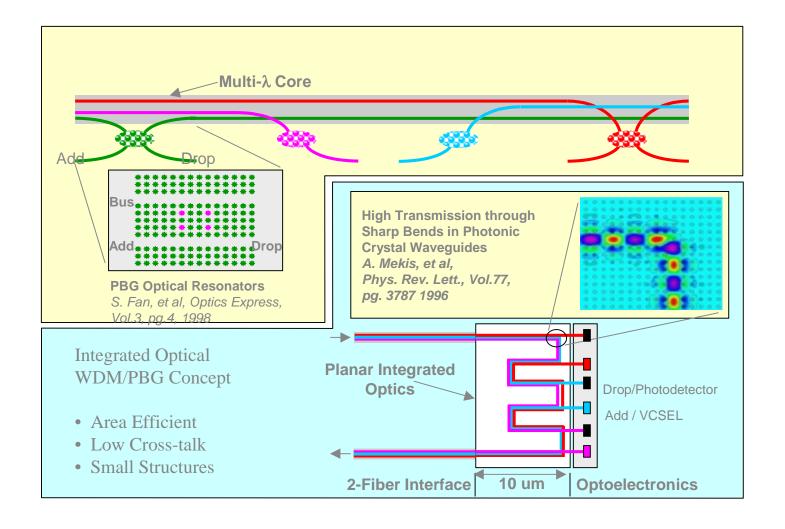

J.S. Foresi, P.R. Villineuve, et al., MIT, Nature, vol. 390, pp. 143-5, 1997

Narrow 2-D PBG fiber waveguide: extra "defect" air core filters white light source

http://www.bath.ac.uk.Departments/Physics/opto/research.htm#pbg

Optical Fiber WDM/PBG Channel Add/ Drop Filter

Photonic Crystal Super- Prisms

Key Characteristics

- Highly anisotropic dispersion engineered "super-prism" material has exceptional angular wavelength dispersion characteristics (NTT, NEC)
- Angular dispersion that is 2 orders of magnitude larger than
 - gratings
 - prisms
 - PBG prism

leads to 2 orders of magnitude shorter WDM elements

- photonic crystal: 0.99 um and 1.00 um separated by 50°
- conventional crystal: 0.99 um and 1.00 um separated < 1°

Fast Reconfigurable Switches for Micro-WDM

Parameter	Electrical	Optical	
Ports	16	32	
Data Rate	1 Gbps	> 2 Gbps	
Media	fiber	fiber	
Switch Fabric	ASIC or network processor	optical ADM or cross-connects	
Matrix Latency	0.5 usec	N/A	
Connect Time	3 usec	0.1 usec to 10's usecs	
Power Consumption	45 W per switch card plus	control only	
	transceivers	(<10 W)	
Protocol	Fibre Channel	IP	
Size	SEM-E card	.001" x .001" to 1' x 1'	
Markets	military platforms and telco	military platforms and telco	

• If 3 order of magnitude improvement in optical switching speed, then...

Possible Electrical to Optical Switch Evolution

- Fast Electrical Packet Switching for Low Port Counts (10's)
- Medium Speed Optical "Circuit" Switching for High Port Counts (1000)
- Fast "MPLS" Optical Switching for "Visionary" Future Systems (TBD)

Optical Switches* (in Decreasing Order of Switch Time)

Technology	Status	Max Array Size (N x N)	Switch Array Time	Insertion Loss	Latching
Bulk optomechanical (tilting mirrrors)	Product	1 x 16	15 msec	2 dB	Yes
Liquid crystal	Development	1 x 8	10 msec	3 dB	No
Bulk optomechanical (free space)	Development	576 x 576	5 msec	6 dB	No
Thermo-Optic	Product ?	8 x 8	1 msec?	5 dB	No
Bubble/ TIR ¹	Product	32 x 32	1 msec?		No
Microelectromechanical	Development	32 x 32	10's usec	3 dB	Yes
Systems (MEMS) ² (+/- 45 ⁰)	(for Optical Switches)				
128 Level MEMS ³	Development	1000 x	1 msec		
2N rather than N ² Limits	(for Optical Switches)	1000			
Microelectromechanical	Development	32 x 32	10's usec	3 dB	Yes
Systems (MEMS) ^{2,3} (+/- 45 ⁰)	(for Optical Switches)				
Microelectromechanical	Product (for Digital	500 K	10's usec	N/A	Yes
Systems (MEMS) ¹ (+/- 10 ⁰)	Light Projectors)				
Lithium	Development	8 x 8	0.1 usec	9 dB	No
Niobate ⁴					
Lithium	Product	4 x 4	0.1 usec	8 dB	No
Niobate

Micro-WDM Development Needs

- Define roadmap to large-scale Micro-WDM
- Trade and down-select micro-WDM technologies
- Perform basic device research
- Improve processing technology
- Develop optimum device designs
- Demonstrate passive WDM arrays
- Perform large-scale device integration
- Integrate high port density switches (near term) (and control)
- Demonstrate initial micro-WDM fast switch concepts
- Establish WDM and switch characterization, test, and measurement

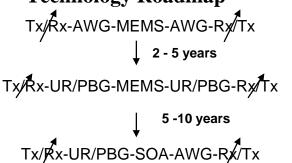

Aerospace Role

- Assess system opportunities and benefits
- Assess & guide micro-WDM technology
 - Device modeling
 - Experimental characterization
 - Recommend optimum technology
- Initiate development team and identify "dual-use" apps
 - Universities, Component Manufacturers
 - passive high density arrays
 - fast switch elements
 - Network Companies
 - software control, management, reliability, optical path routing
- Execute WDM-based network demonstrations
 - integrate tunable Tx/Rx with passive arrays and switches
- Engineer WDM-based networks for deployed systems

Micro-WDM for Reconfigurable Military Information Systems

Goal: Mobile, wideband, scalable, protocol transparent, open systems

Technology Roadmap

0

Relative Risks

- Microresonator CDFs today
- PBG and super-prism CDF arrays
- Design and nano-fabrication
- Fast reconfiguration switches

Channel Drop Filter (CDF)

Related Challenges

- Tunable Sources and Detectors
- Array Cross Talk and Insertion Losses
- Packet or Channel Addressing
- Virtual Light Path Contention:
 - Wavelength Conversion
 - Optical Buffer Memories
 - Synchronization

Summary: 10 um Scale WDM Technology in F/O networks will bring trunking and routing of terabit/sec capacity optical fiber buses to mobile platforms. Fixed and tunable integrated add/drop filters (and N x N optical cross-connects) reduce size and power, provide fault tolerance, reconfiguration, and mixed nets.

Approach

- Smooth, scalable growth will result in migration from IP/ATM/SONET(ADM and DCS)/DWDM networks to MPLS/ optical mesh networks
- Tunable Tx and Rx will enable single part for WDM transport
- Wavelength routing switches will provision λ paths to resources
- May support mixed RF and digital networks in fault tolerant dual rings (and meshes)
